Another way is to split if one side of a clothespin and cut-ine bottom of the remaining part, taking an abnum; then drill a hole to yold splitting the piece and fasten is somewheat place.

## PINNACLE ROCKS ARE MENAGE TO

Federal Department Discards Sounding for Dragging System to Root Up Obstacles.

ARE DIFFICULT TO LOCATE

A Pinnacle Rock is Like an Undersea Dagger to a Ship-Legal Importance of Having Dangerous Rocks Charted Cannot Be Overestimated.

Washington .- If an aviator flew over New York some dark night, plumbing for the Woolworth tower with an ordinary sounding line, he'd have just as much chance of locating the building as the hydrographic experts of the department of commerce have in locat ing pinnacle rocks from ten to thirty feet under the surface of the water by using the same method. Accordingly the department is no longer "sounding" for pinnacle rocks; it is "dragging" for them.

Pinnacle rocks are one of the gravest menaces to navigation that exist in the coastal waters of the United States. New England has the most abundant crop of any locality and the coast of that section is probably the hardest to chart of any American coast. With the new "drag" method in operation, however, charting of pin-nacle rocks is becoming an easy mat-

Not only is a pinnacle rock extreme ly dangerous to navigation, but it is extremely difficult to locate. A pinnacle rock is exactly what its name implies. It is a tall, rocky pinnacle which rises straight from the bottom of the ocean and often the area of its top surface would not be ten square When a vessel strikes one, though, a pinnacle rock is like nothing so much as an undersea dagger.

Speed Was the Thing. Years ago, when the coasts of the United States were first charted, it was necessary to make as much speed as possible and cover the greatest possible territory in the shortest possible time. - Under such conditions the plumbing of coastal localities with sounding line and the determination of shoals by consideration of the general characteristics of the locality were necessary, but these surveys left many uncharted pinnacles behind, to bring disaster to ships later on.

They tell a story of a pinnacle rock incident that occurred on one of Peary's trips to Greenland, back in the late nineties. Peary's ship was holding a straight course for Green-land, but owing to the cloudiness of the weather a lookout was posted. The routine of the ship was suddenly disturbed by the cry of the lookout: "Breakers dead ahead!" The helmsman spun his wheel and the ship heeled sharply to port, just in time to escape a sunken rock which was about three feet under water. Had it not been for the lookout Peary might never have reached the pole.

The department of commerce of authentic charts of many portions of the American coast, and the danger of pinnacle rocks was the real reason why the old plumbline system was dis which is very much similar to the old-

fashioned seine.

A line is run between two motor boats, several hundred yards apart. This line is supported on the water by floats, but suspended from it are other lines, all attached to a long wire, under water, which is held down by weights. The wire under water corresponds exactly to the lower edge of a seine.

Motor Bosts Active

The motor boats are started farward

The motor boats are started farward, keeping an even distance apart. The bottom wire is far enough under water to intercept anything which would rise high enough from the bottom to be a navigation danger, and as long as the floats on the surface drag along with-out going under the motor boats chug away on their course.

But at the first dip of the floats, anywhere along the surface line, the motor boats stop, for the disappearance of the floats indicates the wire under water has struck a smag. If the smag is found to be a rock, its distance from the surface is ascertained and its location immediately charted. Then the wire is disengaged, the motor boats are started again and the department "anag flahers" are off after another "catch."

The department, in a bulletin re-

at very close quarters for years without knowing of its existence

Wire-Drag System. The new wire-drag system is the only system which will definitely and certainly establish the danger or freedom of a certain marine locality for ships. The legal importance of having all dangerous rocks noted on government charts cannot be overestimated. The chart is very often the means of fixing responsibility for a marine dis-aster, either in merchant service or in the navy. The captain, accused of negligence in the navigation of his vessel after having struck an obstruction of some kind, may plead that the ob struction was not noted on the shart. The is particularly true when the

vessel succeeds in getting off before the locality can be definitely ascer tained and the statements of the captain verified or disproved. As the whole purpose of licensing navigators is to make marine travel safe for passengers and property, it is essential that the plea of uncharted rocks be made as untenable as possible

The cost of wire-drag work, considering the value of the results obtained, is not regarded as excessive. The cost of dragging the New England coast ranges anywhere from \$125 to \$175 per square mile, while the work of charting the waters of Florida in the vicin ity of Key West runs much higher. Here it costs from \$450 to \$600 a

## MAY SOLVE OLD MYSTERY

Teeth Lead to Identification of Farmer Who Disappeared Eight Years Ago.

Oklahoma City.-The finding of the skeleton of a man in a ravine near Britton, a few miles north of this city, may solve the mystery of the disappearance eight years ago of W. W. Crabtree, a farmer of that community.

Nothing but the bare bones remain of the body. The skeleton shows a perfect set of teeth, a fact which led acquaintances to identify the skele-ton as that of Crabtree.

On the skull was a dent, probably made by some blunt instrument. Near the plow on which he had been working, when the first search was made was found a monkey wrench.

Crabtree was a successful farmer and lived alone. Little was known of the man at the time he settled on the farm. It was understood that he had come from Oregon, though he never talked of himself.

Sea Soavengers Are Used to War on Mice.

Gulls May Render Important Inland Service to Farmer-California Variety is Extremely Fond of Mice.

Washington.-Not only as sea scavengers are the gulls valuable, but as an aid to agriculture, rendering the farmers a great service in their war-fare against field mice, black crickets and insects, according to the department of agriculture.

"The term 'gull' usually is associated in the popular mind only with the long-winged awimmers seen along the salt water shores and in coast harbors," says a statement issued by the in the United States, however, 23 specles or subspecies of gulls, including the gull-like birds known as skuas and

jacgers. Of these some are true in-land birds. frequenting prairies, marshes and inland lakes.

"Flocks of guils on the waters of our harbors or following the wake of vessels are a familiar sight, but not every observer of the graceful motions of the bird is aware of the fact that gulls are the original 'white

wings."

"As sea scavengers they welcome as food dead fish, garbage and offal of various sorta, and their services in cleaning up such material are not to be regarded lightly. It will, however, surprise many to learn that some of the gull family render important inland service, especially to agriculture. At least one species, the California gull, is extremely foud of field mice, and during an outbreak of that pest in Nevada in 1907-8 hundreds of gulls resembled in and near the devastated alfalfa fields and fad entirely on mice, thus lending the farmers material ald in their warfare against the pestiferous little rodents. The skua also foeds on mice and lessnings.

"Several aspecies of gulls render valuable service to agriculture by destroying insects also, and in agring hundreds of Franklin's gulls in Wiacossia and the Dakotas follow the piowman to pick up the insect larvae uncovered by the share.

"That at least one community has not been unmindful of the substantial debt it owes the gull is attested in Salt Lake City, where stands a monument surmounted by a bronne figure of two gulls, erected by the people of the signal service rendered by these birds at a critical time in the fitstory of the community.

"For three consecutive years—1848, 1849 and 1850—black crickets by millions threatened to ruin the crops apon which depended the very lives of the settlers. Larks flocks of gulls came to the rescus and devoured vant numbers of the destructive insects, until the fields were entirely freed from them." wings."
"As sea scavengers they welco
